7-14
Please revise the paragraph of Page 15, lines-5-12, to read as follows:

CE Slulog

For example, a plurality of body surface probes can be used to obtain simultaneous and comparative measurements from arterial-venous shunt rich palmar surfaces of the hand or plantar surfaces of the foot, and other parts of those limbs which have corresponding surfaces which are arterial venous surfaces which are arterio-venous shunt poor. Such comparisons may help to accentuate the intensity of autonomic nervous system activation, since arterio-venous rich sites have greater autonomic control. Further applications of the invention utilizing two or more such probes are described below particularly with reference to Figs. 10 - 16.
